TRAI Audit Wireless Report for MPCG Circle

QE September 2016

Prepared by:

KANTAR IMRB

Submitted to:

Telecom Regulatory Authority of India
1 TABLE OF CONTENTS

2 Introduction .................................................................................................................. 8
   2.1 About TRAI ........................................................................................................ 8
   2.2 Objectives .......................................................................................................... 8
   2.3 Coverage ........................................................................................................... 9
   2.4 Framework used ................................................................................................. 9
      2.4.1 PMR Reports .............................................................................................. 10
      2.4.2 Live Calling ............................................................................................... 24
      2.4.3 Voice Drive Test – 2G & 3G .................................................................... 27
      2.4.4 Wireless Data Drive Test – 2G & 3G ....................................................... 30
   2.5 Operators Covered 2G and 3G ........................................................................ 34
   2.6 Colour Codes to read the report ...................................................................... 34

3 Critical Findings ........................................................................................................ 35

4 Executive Summary .................................................................................................. 37
   4.1 PMR Data – 3 Months- Consolidated for 2G .................................................. 37
      4.1.1 PMR Data - July for 2G ............................................................................. 39
      4.1.2 PMR Data – August for 2G .................................................................... 39
      4.1.3 PMR Data - September for 2G ................................................................. 40
   4.2 3 Day Data – Consolidated for 2G ................................................................. 41
      4.2.1 3 Day Data - July for 2G .......................................................................... 43
      4.2.2 3 Day Data – August for 2G ................................................................... 43
      4.2.3 3 Day Data - September for 2G ............................................................... 44
   4.3 PMR Data – 3 Months- Consolidated for 3G .................................................. 45
      4.3.1 PMR Data - July for 3G ............................................................................. 46
      4.3.2 PMR Data – August for 3G .................................................................... 46
      4.3.3 PMR Data - September for 3G ................................................................. 46
   4.4 3 Day Data – Consolidated for 3G ................................................................. 47
      4.4.1 3 Day Data - July for 3G .......................................................................... 48
      4.4.2 3 Day Data – August for 3G ................................................................... 48
      4.4.3 3 Day Data - September for 3G ............................................................... 48
TRAI Audit Wireless Report for MPCG Circle

4.5 Wireless data PMR & 3 Day Live – Consolidated for 2G .........................................................49
4.6 Wireless data PMR & 3 Day Live – Consolidated for 3G .........................................................50
4.7 Live Calling Data - Consolidated ...............................................................................................51
4.8 Billing and customer care - Consolidated ..................................................................................52
4.9 Inter Operator Call Assessment - Consolidated .......................................................................53
4.10 Comparison Between IMRB and Operator’s data for PMR 2G ...............................................54
4.11 Comparison Between IMRB and Operator’s data for PMR 3G ...............................................54

5 Critical Findings............................................................................................................................55

6 Parameter Description & Detailed Findings - Comparison Between PMR Data, 3 Day Live Data and Live Calling Data for 2G .................................................................57

6.1 BTS Accumulated Downtime.......................................................................................................57
6.1.1 Parameter Description ............................................................................................................57
6.1.2 Key Findings - Consolidated..................................................................................................58
6.2 Worst Affected BTS due to downtime .......................................................................................61
6.2.1 Parameter Description ............................................................................................................61
6.2.2 Key Findings – Consolidated ................................................................................................62
6.3 Call Set Up Success Rate ...........................................................................................................64
6.3.1 Parameter Description ............................................................................................................64
6.3.2 Key Findings - Consolidated..................................................................................................65
6.4 Network Channel Congestion- Paging Channel /TCH Congestion/POI .................................67
6.4.1 Parameter Description ............................................................................................................67
6.4.2 Key Findings - SDCCH/Paging Channel Congestion (Consolidated) .................................68
6.4.3 Key Findings – TCH Congestion (Consolidated) ..................................................................71
6.4.4 Key Findings – POI Congestion (Consolidated) – Average of 3 months ............................73
6.5 Call Drop Rate ..........................................................................................................................77
6.5.1 Parameter Description ............................................................................................................77
6.5.2 Key Findings - Consolidated..................................................................................................78
6.6 Cells having greater than 3% TCH drop ..................................................................................80
6.6.1 Parameter Description ............................................................................................................80
6.6.2 Key Findings - Consolidated..................................................................................................80
6.7 Voice Quality ............................................................................................................................83
6.7.1 Parameter Description ................................................................. 83
6.7.2 Key Findings ........................................................................... 84

7 Parameter Description & Detailed Findings - Comparison Between PMR Data, 3 Day Live Data and Live Calling Data for 3G ................................................................. 86

7.1 Node Bs downtime ........................................................................... 86
7.1.1 Parameter Description .................................................................. 86
7.1.2 Key Findings - Consolidated ......................................................... 87

7.2 Worst affected Node Bs due to downtime ........................................... 90
7.2.1 Parameter Description ................................................................. 90
7.2.2 Key Findings – Consolidated ......................................................... 91

7.3 Call Set Up Success Rate ................................................................. 93
7.3.1 Parameter Description ................................................................. 93
7.3.2 Key Findings - Consolidated ......................................................... 94

7.4 Network Channel Congestion- RRC Congestion/ Circuit Switched RAB Congestion .......... 97
7.4.1 Parameter Description .................................................................. 97
7.4.2 Key Findings - RRC Congestion (Consolidated) .................................. 99
7.4.3 Key Findings – Circuit Switched RAB Congestion (Consolidated) .......... 101
7.4.4 Key Findings – POI Congestion (Consolidated) – Average of 3 months ...... 103

7.5 Circuit Switched Voice Drop Rate .................................................. 107
7.5.1 Parameter Description ................................................................. 107
7.5.2 Key Findings - Consolidated ......................................................... 108

7.6 Worst affected cells having more than 3% Circuit Switched Voice Drop Rate .......... 110
7.6.1 Parameter Description ................................................................. 110
7.6.2 Key Findings - Consolidated ......................................................... 111

7.7 Circuit Switch Voice Quality .......................................................... 113
7.7.1 Parameter Description ................................................................. 113
7.7.2 Key Findings ........................................................................... 114

8 Parameter Description & Detailed Findings - Wireless Data Services (2G & 3G) ............. 116

8.1 Service Activation /Provisioning for 2G & 3G .................................... 116
8.1.1 Parameter Description ................................................................. 116
8.1.2 Key Findings 2G .................................................................... 117
8.1.3 Key Findings 3G ................................................................. 118
8.2 PDP Context Activation Success Rate for 2G & 3G ................................................................. 119
8.2.1 Parameter Description ............................................................. 119
8.2.2 Key Findings 2G .................................................................. 120
8.2.3 Key Findings 3G .................................................................. 120
8.3 Drop rate for 2G & 3G ................................................................ 121
8.3.1 Parameter Description ............................................................. 121
8.3.2 Key Findings 2G .................................................................. 122
8.3.3 Key Findings 3G .................................................................. 122
9 Parameter Description and Detailed Findings – Non-Network Parameters .................. 123
  9.1 Metering and billing credibility ........................................................................ 123
  9.1.1 Parameter Description ........................................................................ 123
  9.1.2 Key Findings – Metering and billing credibility (Postpaid) ......................... 125
  9.1.3 Key Findings - Metering and billing credibility (Prepaid) .......................... 126
  9.2 Resolution of Billing/Charging Complaints .................................................. 127
  9.2.1 Parameter Description ........................................................................ 127
  9.2.2 Key Findings - within 4 weeks ............................................................. 128
  9.2.3 Key Findings within 6 weeks ............................................................... 129
  9.3 Period of Applying Credit/Wavier .......................................................... 130
  9.3.1 Parameter Description ........................................................................ 130
  9.3.2 Key Findings ................................................................................. 130
  9.4 Call Centre Performance-IVR ............................................................... 131
  9.4.1 Parameter Description ........................................................................ 131
  9.4.2 Key Findings ................................................................................. 131
  9.5 Call Centre Performance-Voice to Voice ................................................... 132
  9.5.1 Parameter Description ........................................................................ 132
  9.5.2 Key Findings ................................................................................. 133
  9.6 Termination/Closure of Service ............................................................... 134
  9.6.1 Parameter Description ........................................................................ 134
  9.6.2 Key Findings ................................................................................. 134
  9.7 Refund of Deposits After closure ................................................................ 135
9.7.1 Parameter Description ................................................................................................................. 135
9.7.2 Key Findings ................................................................................................................................. 136
10 Detailed Findings - Drive Test Data ................................................................................................. 137
10.1 Operator Assisted Drive Test - voice ............................................................................................. 137
10.1.1 CHHATARPUR SSA .................................................................................................................. 138
10.1.2 DEWAS SSA ............................................................................................................................... 145
10.1.3 INDORE SSA .............................................................................................................................. 152
10.1.4 KHANDWA SSA .......................................................................................................................... 159
10.1.5 KHARGONE SSA ........................................................................................................................ 166
10.1.6 RATLAM SSA .............................................................................................................................. 173
10.1.7 CHHINDWARA SSA .................................................................................................................... 180
10.1.8 JABALPUR SSA ............................................................................................................................ 187
10.1.9 PANNA SSA ................................................................................................................................. 194
10.1.10 RAIPUR SSA .............................................................................................................................. 201
10.1.11 SEONI SSA ............................................................................................................................... 208
10.1.12 RAIGARH SSA .......................................................................................................................... 215
11 Annexure – Consolidated-2G .............................................................................................................. 222
11.1 Network Availability ....................................................................................................................... 222
11.2 Connection Establishment (Accessibility) ....................................................................................... 223
11.3 Connection Maintenance (Retainability) ....................................................................................... 224
11.4 Voice quality ................................................................................................................................ 225
11.5 POI Congestion ............................................................................................................................... 227
12 Annexure – Consolidated-3G .............................................................................................................. 228
12.1 Network Availability ....................................................................................................................... 228
12.2 Connection Establishment (Accessibility) ....................................................................................... 229
  Connection Maintenance (Retainability) ............................................................................................ 229
12.3 Voice quality ................................................................................................................................ 232
12.4 POI Congestion ............................................................................................................................... 233
13 Annexure – Customer Services......................................................................................................... 234
13.1 Metering and billing credibility .................................................................................................... 234
13.2 Customer Care ............................................................................................................................... 236
13.3 Termination / closure of service................................................................. 239
13.4 Time taken for refund of deposits after closure......................................... 239
13.5 Live Calling Results for Resolution of Service Requests .............................. 240
13.6 Live Calling Results for Level 1 Services...................................................... 240
13.7 Level 1 Service calls made........................................................................... 241

14 Counter Details......................................................................................... 255
14.1.1 Ericsson .................................................................................................. 257
14.1.2 NSN (Nokia Siemens Networks).............................................................. 259
14.2 Block Schematic Diagrams........................................................................... 260
14.2.1 Ericsson .................................................................................................. 260
14.2.2 NSN (Nokia Siemens Networks).............................................................. 261

15 Abbreviations............................................................................................. 262
INTRODUCTION

2.1 ABOUT TRAI

TRAI’s mission is to create and nurture conditions for growth of telecommunications in the country in a manner and at a pace that will enable India to play a leading role in the emerging global information society. One of the main objectives of TRAI is to provide a fair and transparent policy environment which promotes a level playing field and facilitates fair competition.

In pursuance of above objective, TRAI has been issuing regulations, order and directives to deal with the issues or complaints raised by the operators as well as the consumers. These regulations, order and directives have helped to nurture the growth of multi operator multi service - an open competitive market from a government owned monopoly. Also, the directions, orders and regulations issued cover a wide range of subjects including tariff, interconnection and quality of service as well as governance of the Authority.

TRAI initiated a regulation - The Standard of Quality of Service of Basic Telephone Service (Wireline) and Cellular Mobile Telephone Service regulations, 2009 (7 of 2009) dated December 20, 2009 and Quality of Service of Broadband Service Regulations, 2006 (11 of 2006) dated October 6, 2006 that provide the benchmarks for the parameters on customer perception of service to be achieved by service provider.

In order to assess the above regulations, TRAI has commissioned a third party agency to conduct the audit of the service providers and check the performance of the operators on the various benchmarks set by Telecom Regulatory Authority of India (TRAI).

2.2 OBJECTIVES

The primary objective of the Audit module is to-

- Audit and Assess the Quality of Services being rendered by Basic (Wireline), Cellular Mobile (Wireless), and Broadband service against the parameters notified by TRAI. (The parameters of Quality of Services (QoS) have been specified by in the respective regulations published by TRAI).
- This report covers the audit results of the audit conducted for Cellular Mobile (Wireless) services in MPCG circle.
2.3 COVERAGE

The audit was conducted in MPCG circle covering all the SSAs (Secondary Switching Areas).

2.4 FRAMEWORK USED

Let’s discuss each of the activity in detail and the methodology adopted for each of the module.
2.4.1 PMR REPORTS

2.4.1.1 SIGNIFICANCE AND METHODOLOGY

PMR or Performance Monitoring Reports are generated to assess the various Quality of Service parameters involved in the mobile telephony service, which indicate the overall health of service for an operator.

The IMRB auditors inform the operators about the audit schedule in advance. Accordingly, the auditors visit the operator premises to conduct the audit.

During TRAI audit, raw data is extracted from the operator’s server/ NOC/ exchange/ OMC/ customer service center/ billing center etc. by the IMRB auditor with assistance from the operator personnel in order to generate PMR reports (Network/ Billing/ Customer Service etc).

All the calculations are done by IMRB auditors to generate a new PMR report from that raw data.

The newly generated PMR reports are then taken in hard copy, duly signed by the competent authority of operators. IMRB auditors also sign the same report.

The PMR report for network parameters is taken for each month of the audit quarter and is extracted and verified in the first week of the subsequent month of the audit month. For example, July 2016 audit data was collected in the month of August 2016.

The PMR report for customer service parameters is extracted from Customer Service Center and verified once every quarter in the subsequent month of the last month of the quarter. For example, data for quarter ending September 2016 (JAS’16) was collected in the month of October 2016.

The raw data extracted from operator’s systems is used to create PMR in the following three formats.

- Monthly PMR (Network Parameters & Wireless Data Services) – 2G & 3G
- 3 Day Live Measurement Data (Network Parameters & Wireless Data Services) – 2G & 3G
- Customer Service Data

Let us understand these formats in detail.
2.4.1.2 MONTHLY PMR 2G

This involved calculation of the various 2G Quality of Service network parameters through monthly Performance Monitoring Reports (PMR). The PMR reports were generated from the data extracted from operator’s systems by the IMRB representative with the assistance of the operator at the operator’s premises for the month of July, August and September 2016. The performance of operators on various parameters was assessed against the benchmarks. Parameters include-

- **Network Availability**
  - BTS accumulated downtime
  - Worst affected BTS due to downtime

- **Connection Establishment (Accessibility)**
  - Call Set Up success Rate (CSSR)

- **Network Congestion Parameters**
  - SDCCH/Paging Channel Congestion
  - TCH Congestion
  - Point of Interconnection

- **Connection Maintenance**
  - Call Drop rate
  - Worst affected cells having more than 3% TCH drop

- **Voice Quality**
  - % Connections with good voice quality

All the parameters have been described in detail along with key findings of the parameters in section 5 of the report. The benchmark values for each parameter have been given in the table below.
2.4.1.3 AUDIT PARAMETERS – NETWORK 2G

Let us now look at the various parameters involved in the audit reports.

**Network Related**

<table>
<thead>
<tr>
<th>Parameter Category</th>
<th>Parameter</th>

<td>≥ 95%</td>
</tr>
<tr>
<td></td>
<td>Point of Interconnection (POI)</td>
<td>≤ 0.5%</td>
</tr>
</tbody>
</table>
2.4.1.4 MONTHLY PMR 3G

This involved calculation of the various 3G Quality of Service network parameters through monthly Performance Monitoring Reports (PMR). The PMR reports were generated from the data extracted from operator's systems by the IMRB representative with the assistance of the operator at the operator’s premises for the month of July, August and September 2016. The performance of operators on various parameters was assessed against the benchmarks. Parameters include-

### Network Availability
- Node Bs accumulated downtime
- Worst affected Node Bs due to downtime

### Connection Establishment (Accessibility)
- Call Set Up success Rate (CSSR)

### Network Congestion Parameters
- RRC Congestion
- Circuit Switched RAB Congestion
- Point of Interconnection

### Connection Maintenance
- Circuit Switched Voice Drop rate
- Worst affected cells having more than 3% Circuit switched Voice drop rate

### Voice Quality
- % Connections with good Circuit Switched Voice Quality

All the parameters have been described in detail along with key findings of the parameters in section 5 of the report. The benchmark values for each parameter have been given in the table below.
2.4.1.5 AUDIT PARAMETERS – NETWORK 3G

Let us now look at the various parameters involved in the audit reports.

**Network Related**

</tbody>
</table>

2.4.1.6 MONTHLY PMR – WIRELESS DATA SERVICES (2G & 3G)

The PMR report for wireless data service (2G and 3G) is extracted at the operator premises and verified every month of the quarter. This includes three parameters:

- Services Activation/provisioning: Activation done within 4 hours ≥ 95%
- PDP Context activation success rate: PDP Context activation success rate ≥ 95%
- Drop Rate: Drop Rate ≤ 5%

2.4.1.7 AUDIT PARAMETERS – WIRELESS DATA SERVICES (2G & 3G)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Activation</td>
<td>Activation done within 4 hours ≥ 95%</td>
</tr>
<tr>
<td>PDP Context activation success rate</td>
<td>PDP Context activation success rate ≥ 95%</td>
</tr>
<tr>
<td>Drop Rate</td>
<td>Drop Rate ≤ 5%</td>
</tr>
</tbody>
</table>
2.4.1.8 POINT OF DATA EXTRACTION

The data is extracted from a terminal/computer connected to OMCR & OSS on the operator network.
2.4.1.9 **STEP BY STEP AUDIT PROCEDURE**

The key steps followed for extraction of reports at the operator premises are given below.

1. Tender document and latest list of licensees as per TRAI are taken as a reference document for assimilating the presence of operators. The wireless operators are then contacted for the audit.

2. Audit formats and schedule is shared with the operators in advance. Details include day of the visit and date of 3 day data collection and other requirements.

3. IMRB auditors visit the operator’s server/exchange/central NOC to extract data from operator’s systems. Operator personnel assist the auditor in extraction process.

4. The extracted data is validated and verified by the IMRB auditors.

5. IMRB auditors then prepare a PMR report from the extracted data with assistance from the operator.

6. IMRB auditors validate the values with raw data and also provide their comments, wherever required.

7. The final audit or PMR sheet is signed by the operator person in-charge along with authorized stamp.

Data has been extracted and calculated as per the counter details provided by the operators. The details of counters have been provided in section 8.15 of the report. The calculation methodology for each parameter has been stated in the table given below.
### 2.4.1.10 Calculation Methodology – Network Parameters 2G

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Calculation Methodology</th>

</tr>
</tbody>
</table>
2.4.1.12 3 DAY LIVE DATA

The main purpose of 3 day live measurement is to evaluate the network parameters on intraday basis. While the monthly PMR report provides an overall view of the performance of QoS parameters, the 3 day live data helps looking at intraday performance on the network parameters discussed earlier. All the calculations are done on the basis of that raw data of 3 days.

The 3 day live data provides a sample of 9 days in a quarter (3 days each month of a quarter) with hourly performance, which enables the auditor to identify and validate intraday issues for an operator on the QoS network parameters. For example, network congestion being faced by an operator during busy/peak hours.

Network related parameters were evaluated for a period of 3 days in each month. 3 day live audit was conducted for 3 consecutive weekdays for each month. The data was extracted from each operator’s server/ NOC etc. at the end of the 3rd day. The extracted data is then used to create a report (similar to PMR report) to assess the various QoS parameters.

The 3 day live measurement was conducted for network parameters (2G & 3G) and wireless data services (2G & 3G).

2.4.1.13 TCBH – SIGNIFICANCE AND SELECTION METHODOLOGY

As per QoS regulations 2009 (7 of 2009), Time Consistent Busy Hour” or “TCBH” means the one hour period starting at the same time each day for which the average traffic of the resource group concerned is greatest over the days under consideration and such Time Consistent Busy Hour shall be established on the basis of analysis of traffic data for a period of ninety days.

Step by step procedure to identify TCBH for an operator:

Day wise raw data is fetched from the operator’s OMCR and kept in a readable format (preferably MS-Excel). Data for a period of 90 days is used to identify TCBH.

The 90 day period is decided upon the basis of month of audit. For example, for audit of Aug 2015, the 90 day period data used to identify TCBH would be the data of Dec, Jul and Aug 2015.

For each day, the hour in which average traffic of the resource group concerned is greatest for the day will be the ‘Busy Hour’ for the operator.

The modal frequency of the busy hour is calculated for 90 days period and the hour with highest modal frequency will be considered as TCBH for the operator.
2.4.1.14 CBBH – SIGNIFICANCE AND SELECTION METHODOLOGY

As per QoS regulations 2009 (7 of 2009), Cell Bouncing Busy Hour (CBBH) means the one hour period in a day during which a cell in cellular mobile telephone network experiences the maximum traffic.

Step by step procedure to identify CBBH for an operator:

Day wise raw data is fetched from the operator’s OMCR and kept in a readable format (preferably MS-Excel). Data for a period of 90 days is used to identify CBBH.

For each day, the hour in which a cell in cellular mobile telephone network experiences maximum traffic for the day will be the ‘Busy Hour’ for the operator.

The 90 day period is decided upon the basis of month of audit. For example, for audit of Dec 2015, the 90 day period data used to identify CBBH would be the data of Oct, Nov and Dec 2015.

The modal frequency of the busy hour is calculated for 90 days period and the hour with highest modal frequency will be considered as CBBH for the operator.

2.4.1.15 CUSTOMER SERVICE PARAMETERS

The data to generate PMR report for customer service parameters is extracted at the operator premises and verified once every quarter in the subsequent month of the last month of the quarter. For example, data for quarter ending September 2016 (JAS’16) was collected in the month of October 2016. To extract the data for customer service parameters for the purpose of audit, IMRB auditors primarily visit the following locations/ departments/ offices at the operator’s end.

- Central Billing Center
- Central Customer Service Center

The operators are duly informed in advance about the audit schedule.

The Customer Service Quality Parameters include the following:

- Metering and billing credibility (postpaid and prepaid)
- Resolution of billing/charging complaints
- Period of applying credit/waiver/adjustment to customer’s account
- Response time to the customer for assistance
- Termination/closure of service
- Time taken for refund of security deposit after closures.
Most of the customer service parameters were calculated by averaging over the quarter; however billing parameters were calculated by averaging over one billing cycle for a quarter.

All the parameters have been described in detail along with key findings of the parameter in section 6 of the report. The benchmark values for each parameter have been given in the table below.

### 2.4.1.16 AUDIT PARAMETERS – CUSTOMER SERVICE

<td>Billing or Charging Complaints resolved in 4 weeks from date of receipt / Total billing or charging complaints received during the quarter) x 100</td>
</tr>
<tr>
<td></td>
<td>Billing or Charging Complaints resolved in 6 weeks from date of receipt / Total billing or charging complaints received during the quarter) x 100</td>
</tr>
<tr>
<td>Period of applying credit waiver</td>
<td>Number of cases where credit waiver is applied within 7 days/ total number of cases eligible for credit waiver * 100</td>
</tr>
<tr>
<td>Call centre performance IVR (Calling getting connected and answered by IVR)</td>
<td>Number of calls connected and answered by IVR/ All calls attempted to IVR * 100</td>
</tr>
<tr>
<td>Call centre performance (Voice to Voice)</td>
<td>Call centre performance Voice to Voice = (Number of calls answered by operator within 90 seconds/ All calls attempted to connect to the operator) * 100</td>
</tr>
<tr>
<td></td>
<td>The calculation excludes the calls dropped before 90 seconds</td>
</tr>
<tr>
<td>Time taken for termination/ closure of service</td>
<td>Number of closures done within 7 days/ total number of closure requests * 100</td>
</tr>
<tr>
<td>Time taken for refund for deposit after closures</td>
<td>Number of cases of refund after closure done within 60 days/ total number of cases of refund after closure * 100</td>
</tr>
</tbody>
</table>
2.4.2  LIVE CALLING

2.4.2.1  SIGNIFICANCE AND METHODOLOGY

The main purpose of live calling is to verify the performance of various customer service parameters by doing test calls to the subscribers/ specific numbers. Below is a step wise procedure of live calling.

1. The IMRB auditor visits each operator premises to do live calling. The operators provide the raw data of customer complaints (billing & service) and also the list of customer service numbers to be verified through live calling.

2. IMRB auditors then make live calls using operator SIM to a random sample of subscribers from the raw data provided to verify the resolution of complaints.

3. The auditors also verify the performance of call center, level 1 services by calling the numbers using operator SIM. The list of call center numbers is provided by the operator. The process followed to test Level 1 services has been stated below.

4. Using operator SIM, the auditors also make test calls to subscribers of other operators to assess the inter-operator call connectivity in the same licensed service area.

Live calling activity was carried out during the period of September 2016. The data considered for live calling was for the month prior to the month in which the live calling activity was being conducted. In this case, data of August 2016 was considered for live calling activity conducted in September 2016.

A detailed explanation of each parameter is explained below.

2.4.2.2  BILLING COMPLAINTS

Live calling is done to verify Resolution of billing complaints within stipulated time. The process for this parameter is stated below.

- Auditors request the operator provided the database of all the subscribers who reported billing complaints in one month prior to IMRB auditor visit. In case of BSNL, data for the complaints from the subscribers belonging to the sample exchanges is requested specifically.
- A sample of 10% or 100 complainants, whichever is less, is selected randomly from the list provided by operator.

Calls are made by auditors to the sample of subscribers to check and record whether the complaint was resolved within the timeframes as mentioned in the benchmark.
All the complaints related to billing as per clause 3.7.2 of QoS regulation of 20th December, 2009 were considered as population for selection of samples. A complete list of the same has been provided in Section 6.1.1.

**TRAI benchmark**

**Resolution of billing/charging complaints** - 98% within 4 weeks, 100% within 6 weeks

---

### 2.4.2.3 SERVICE COMPLAINTS REQUESTS

“Service request” means a request made to a service provider by its consumer pertaining to his account, and includes:

- A request for change of tariff plan
- A request for activation or deactivation of a value added service or a supplementary service or a special pack
- A request for activation of any service available on the service provider’s network
- A request for shift or closure or termination of service or for billing details

All the complaints other than billing were covered. A total of 100 calls per service provider for each service in licensed service area were done by the IMRB auditors.

---

### 2.4.2.4 LEVEL 1 SERVICE

Level 1 is used for accessing special services like emergency services, supplementary services, inquiry and operator-assisted services.

Level 1 Services include services such as police, fire, ambulance (Emergency services). Test calls were made from operator SIMs. A total of 300 test calls were made per service provider in the quarter.

In JAS’16, IMRB has tried contacting the list of Level 1 services provided by TRAI as per the NNP (National Numbering Plan).

---

### 2.4.2.4.1 PROCESS TO TEST LEVEL 1 SERVICES

- On visiting the operator’s premises (Exchange/Central Server etc.), auditors ask the operator authorized personnel to provide a list of Level 1 services being active in their service. The list should contain a description of the numbers along with dialing code.
- Operators might provide a long list of L1 services. To identify emergency L1 service numbers, auditors check if there is any number that starts with code ‘10’ in that list. If auditors find any emergency number in addition to the below list, that number is also tested during live calling.
- On receiving the list, auditors verify it if the below given list of numbers are active in the service provider’s network.
- If there are any other additional numbers provided by the operator, auditors also do live calling on those numbers along with below list.
- If any of these numbers is not active, then we would write the same in our report, auditors write in the report.
- Post verifying the list, auditors do live calling by equally distributing the calls among the various numbers and update the results in the live calling sheet.
2.4.2.5 CUSTOMER CARE

Live calling is done to verify response time for customer assistance is done to verify the performance of call center in terms of

- Calls getting connected and answered by operator’s IVR.
- % age of calls answered by operator / voice to voice) within 90 seconds: In 95% of the cases or more

The process for this parameter is stated below.
Overall sample size is 100 calls per service provider per circle at different points of time, evenly distributed across the selected exchanges – 50 calls between 1100 HRS to 1400 HRS and 50 calls between 1600 HRS to 1900 HRS.

Time to answer the call by the operator was assessed from the time interviewer pressed the requisite button for being assisted by the operator.

All the supplementary services that have any kind of human intervention are to be covered here. It also includes the IVR assisted services.

2.4.2.6 INTER OPERATOR CALL ASSESSMENT

A total of 100 calls per service provider to all the other service providers in a licensed service area were done for the purpose of audit.

2.4.3 VOICE DRIVE TEST – 2G & 3G

2.4.3.1 SIGNIFICANCE AND METHODOLOGY

Drive test, as the name suggests, is conducted to measure the performance of an operator in a moving vehicle in a specified network coverage area. The main purpose of the drive test is to check the health of the mobile network of various operators in the area in terms of coverage (signal strength), voice quality, call drop rate, call set up success rate etc.

To assess the indoor coverage, the test is also conducted at two static indoor locations in each SSA, such as Malls, office buildings, shopping complexes, government buildings etc.

IMRB conducted two types of drive tests as mentioned below.

- Operator Assisted Drive Test
- Independent Drive Test

The main difference between the two is that in the operator assisted, operators participate in the drive test along with their hardware, software, phones etc. while in the independent drive test IMRB conducts the drive test on solitary basis and uses its own hardware. Operators generally do not have any knowledge of the drive test being conducted.

A detailed explanation of the two methodologies has been provided below.

2.4.3.2 OPERATOR ASSISTED DRIVE TEST – VOICE 2G & 3G

SSAs are selected according to the total no. of SSAs on that region and audited in each quarter, at least 1 SSA in each month it may be more depends on the total no. of drive on that circle. The drive tests were conducted for all operators in the circle, for both 2G and 3G voice services. As per TRAI instructions, the 2G drive was done in 2G only mode, while 3G drive test was conducted in dual mode (3G on priority).

As per the new directive given by TRAI headquarters, drive test in the quarter were conducted at a SSA level. SSAs have been defined in two categories by TRAI as per the criticality of the SSA.

1. Normal SSA
2. Difficult SSA
During the drive test in normal SSA, the methodology adopted for the drive test is:

- 3 consecutive days were selected for drive test in selected SSA and SSA list was finalized by TRAI office New Delhi.
- On an average, a minimum of 80 kilometers was covered each day, covering a minimum distance of 250kms in 3 days.
- Route map was designed in such a way that all the major roads, highways and all the important towns and villages were covered as part of audit.
- Special emphasis was given to those areas where the number of complaints received were on the higher side, if provided by TRAI Office New Delhi.
- The route is defined in a way that we cover maximum area in the SSA and try to cover maximum villages and cities within the SSA. The route is designed such that there is no overlap of roads (if possible).
- The route was classified as:
  - With In city
  - Major Roads
  - Highways
  - Shopping complex/ Mall
  - Office Complex/ Government Building
- There were no fixed calls which we need to do for within city, major roads and highways, but a minimum of 30 calls in each route, i.e., within city, major roads and highways on each day. For indoors, 20 calls each for shopping and office complex each day preferably in relatively bigger city.
- The drive test covered selected cities and adjoining towns/rural areas where the service provider has commenced service, including congested areas and indoor sites.
- The drive test of each mobile network was conducted between 10 am and 8 pm on weekdays.
- The Vehicle used in the drive tests was equipped with the test tool that automatically generates calls on the mobile telephone networks.
- The speed of the vehicle was kept at around 30-50 km/hr.
- The holding period of each test call was 120 seconds.
- A test call was generated 10 seconds after the previous test call is completed. For 3G, the gap between two calls was 30 seconds.
- Height of the antenna was kept uniform in case of all service providers.

In drive test for difficult SSAs, the methodology adopted for the drive test is:-

- Drive test was conducted for 6 consecutive days in selected SSAs and SSA list was finalized by TRAI office New Delhi.
- On an average, a minimum of 80 kilometers was covered each day, covering a minimum distance of 500kms in 6 days.

Rest of the activities for drive test in difficult SSAs are same as drive test for normal SSAs.

2.4.3.3 INDEPENDENT DRIVE TEST – 2G & 3G

The number of independent drive tests to be conducted and their locations are decided basis TRAI recommendation.

- A minimum of 80 kilometers was traversed during the independent drive test in a SSA on each day and SSA list was finalized by TRAI office New Delhi.
- Route map was designed in such a way that all the major roads, highways and all the important towns and villages were covered as part of audit.
Special emphasis was given to those areas where the number of complaints received were on the higher side, if provided by TRAI.

The route is defined in a way that we cover maximum area in the SSA and try to cover maximum villages and cities within the SSA. The route is designed such that there is no overlap of roads (if possible).

The route was classified as-
- With In city
- Major Roads
- Highways
- Shopping complex/ Mall
- Office Complex/ Government Building

There were no fixed calls which we need to do for within city, major roads and highways, but a minimum of 30 calls in each route, i.e., within city, major roads and highways on each day. For indoors, 20 calls each for shopping and office complex each day preferably in relatively bigger city.

The drive test covered selected cities and adjoining towns/rural areas where the service provider has commenced service, including congested areas and indoor sites.

The drive test of each mobile network was conducted between 10 am and 8 pm on weekdays.

The Vehicle used in the drive tests was equipped with the test tool that automatically generates calls on the mobile telephone networks.

The speed of the vehicle was kept at around 30-50 km/hr.

The holding period of each test call was 120 seconds.

A test call was generated 10 seconds after the previous test call is completed. For 3G, the gap between two calls was 30 seconds.

Height of the antenna was kept uniform in case of all service providers.

2.4.3.4 PARAMETERS EVALUATED DURING VOICE DRIVE TEST – 2G & 3G

The parameters which were captured during the drive test include. Below are the parameters which are captured for the GSM and CDMA operators.

Coverage-Signal strength (GSM)
- Total calls made (A)
- Number of calls with signal strength between 0 to -75 dBm
- Number of calls with signal strength between 0 to -85 dBm
- Number of calls with signal strength between 0 to -95 dBm

Coverage-Signal strength (CDMA)
- Total Ec/Io BINS (A)
- Total Ec/Io BINS with less than -15 (B)
- Low Interference = [1 - (B/A)] x 100

Voice quality (GSM)
- Total RxQual Samples – A
- RxQual samples with 0-5 value – B
- %age samples with good voice quality = B/A x 100

Voice quality (CDMA)
- Total FER BINS (forward FER) – A
- FER BINS with 0-2 value (forward FER) – B
- FER BINS with 0-4 value (forward FER) – C
- %age samples with FER bins having 0-2 value (forward FER) = B/A x 100
- %age samples with FER bins having 0-4 value (forward FER) = C/A x 100
- No. of FER samples with value > 4 = [A-C]
Call setup success rate
- Total number of call attempts – A
- Total Calls successfully established – B
- Call success rate (%age) = (B/A) x 100

Blocked calls
- 100% - Call Setup Rate

Call drop rate
- Total Calls successfully established – A
- Total calls dropped after being established – B
- Call Drop Rate (%age) = (B/A) x 100

2.4.4 WIRELESS DATA DRIVE TEST – 2G & 3G

The data drive test is conducted at stationary places called hotspots in a SSA for all the days the voice drive test is conducted in the same SSA.

2.4.4.1 METHODOLOGY

The measurement setup is used to conduct test calls for measuring successful data transmission download and upload attempts, minimum download speed, average throughput and latency is given in figure given below.

The basic measurement set-up consists of a Test-Device and a Test-Server with specified software and hardware. Test calls are established between the Test-Device and Test-Server and measurements are made for the respective QoS parameters. These parameters are measured in a stationary mode. Service Activation/Provisioning, PDP Context Activation Success Rate and Drop rate are reported from the actual network counters/database.

To assess the quality of the connection between an end user and an Internet Service Provider (ISP), ideally the Test-Server is placed as near as possible to the gateway providing the interconnection between access network and ISP network. The location of the test-server is as near as possible to the gateway providing the interconnection between access network and ISP network implies that the measurements will not reflect the influence in the QoS of the ISP network, between that gateway and the gateway interconnecting with the Internet.
2.4.4.2 REQUIREMENTS FOR THE TEST-SERVER

For all tests, a dedicated test server is used as a well-defined reference. The test server may be located centrally for all the licensed service areas (LSA) or for a number of LSAs or in each LSA (not more than one in each LSA). Under no circumstances a commercial server (e.g. www.yahoo.com) is used, since the test conditions for such a server may change over time making later reproduction of the results impossible. The test server is identified by an IP address and not by its fully qualified Domain Name (FQDN) in order to avoid issues with Domain Name Server (DNS) lookup and including the DNS caching strategies of the used operating system into the measurement.

The Transmission Control Protocol (TCP) settings of the server tested against, is also recorded. Since the number of host operating systems for internet servers is larger than on the client side, no detailed recommendation concerning the TCP settings of the server is given.

However, the TCP stack of the reference server should at least be capable of the following:

- Maximum Segment Size between 1380 Bytes and 1460 Bytes.
- TCP RX Window Size > 4096 Bytes
- SACK (Selective Acknowledgement) enabled.
- TCP Fast Retransmit.
- TCP Fast Recovery enabled.
- Delayed ACK enabled (200ms).
2.4.3 TEST FILES

The test file consist of incompressible data i.e. a data file that is already compressed, e.g. like a zip or jpg file. The test file has at least twice the size (in Kbit) of the theoretically maximum data transmission rate per second (in Kbit/s) of the Internet access under consideration.

2.4.4 REPRESENTATIVENESS OR NUMBER OF TEST CALLS

- The choice of adequate test calls, i.e. geographical locations of origin and destination of calls as well as traffic variations, is a crucial point with respect to the comparability and validation of the statistics are calculated for the measured parameters. For each parameter, it is ensured that the samples are aggregated over all classes of customers for fairness in reflecting the QoS actually perceived by the user and the statistics are preserved to substantiate the same.
- The necessary number of samples (test calls) are 1067 for each of the category “A” and “Metro” licensed service area (LSA), 600 for each of the category “B” LSA and 384 for each of the category “C” LSA for all the parameters.

2.4.5 PARAMETERS EVALUATED DURING DATA DRIVE TEST AT HOTSPOTS

2.4.5.1 SUCCESSFUL DATA TRANSMISSIONS DOWNLOAD ATTEMPTS

The successful data download attempts is defined as the ratio of successful data downloads to the total number of data download attempts in a specified time period. A data transmission is successful if a test file is downloaded completely and with no errors.

**Measurement:**

The percentage that is the sum total of successful data downloads, divided by the sum total of all attempts to download a test file is provided. The statistics are calculated from test calls made according to the measurement set-up and taking into account the representativeness requirements. The successful data download is measured by downloading a test file. An attempt to transmit the test file is considered unsuccessful if it takes longer than 60 seconds.

**Successful data transmission download attempts =**

\[
\frac{\text{Total Successful download attempts}}{\text{Total download attempts}} \times 100
\]
2.4.4.5.2 SUCCESSFUL DATA TRANSMISSION UPLOAD ATTEMPTS

The successful data upload attempts is defined as the ratio of successful data uploads to the total number of data upload attempts in a specified time period. A data upload is successful if a test file is uploaded completely and with no errors.

**Measurement:**

The percentage that is the sum total of successful data uploads, divided by the sum total of all attempts to upload a test file should be provided. The statistics are calculated from test calls made according to the measurement set-up and taking into account the representativeness requirements. The successful data upload is measured by uploading a test file. An attempt to transmit the test file is considered unsuccessful if it takes longer than 60 seconds.

\[
\text{Successful data transmission upload attempts} = \frac{\text{Total Successful upload attempts}}{\text{Total upload attempts}} \times 100
\]

2.4.4.5.3 MINIMUM DOWNLOAD SPEED

The download speed is defined as the data transmission rate that is achieved for downloading a test file from a test server to a test device.

**Measurement:**

The minimum download speed is calculated from test calls made according to the measurement set-up. Test calls are to be made to weigh the results according to the patterns of real traffic. Minimum download speed is the average of the lower 10% of all such test calls.

\[
\text{Minimum download speed (average of lower 10% of all test calls)} = \frac{\text{Download speed } (A1+A2+A3+A4+A5+A6)}{6} \times 100
\]

**Note:** A1, A2, A3, A4 A5 & A6 are download speeds at 6 hotspots

2.4.4.5.4 AVERAGE THROUGHPUT FOR PACKET DATA

It is defined as the rate at which packets are transmitted in a network. In a mobile network the download speed varies depending on the number of users in a particular location. Even though a service provider may be advertising certain speed, the actual speed may vary as per the number of users in the network and there could be customer dissatisfaction on account of relatively slow speed. Hence, there is a need to prescribe an average throughput to protect the interest of consumers. The service providers need to constantly upgrade their network to meet average throughput benchmark.

- The throughput is defined as the data transmission rate that is achieved for downloading a test file from a test server to a test device.
- The service provider will advertise the throughput being offered to its customers as per their category or plan and it should be meted out as per their commitment.

**Measurement:**

The average throughput for packet data should be calculated from all the test calls made according to the measurement setup.
Test calls are made to weigh the results according to the patterns of real traffic. Average throughput is calculated as the average of all such test calls.

**Average Throughput for Packet data** = Average of download attempts in Kbit/ average download time in secs

### 2.4.4.5.5 LATENCY

Latency is the amount of time taken by a packet to reach the receiving endpoint after being transmitted from the sending point. This time period is termed the “end-to-end delay” occurring along the transmission path. Latency generally refers to network conditions, such as congestion, that may affect the overall time required for transit.

**Measurement:**

Latency is measured with the test server for ping connected directly to the server on the same Intranet domain.

\[
\text{Latency (Percentage of successful pinged)} = \frac{\text{Total number of successful ping}}{\text{Total number of ping sent to the Test Server}} \times 100
\]

### 2.5 OPERATORS COVERED 2G AND 3G

September ’16 VLR data was considered for the number of subscribers.

### 2.6 COLOUR CODES TO READ THE REPORT

- **Not Meeting the benchmark**
- **Best Performing Operator**
3 CRITICAL FINDINGS

PMR and 3day live consolidated 2G (Network Parameters)

- Vodafone failed to meet the benchmark for Worst Affected Cells having more than 3% TCH drop during PMR audit.

PMR and 3Days live consolidated 3G (Network Parameters)

- All operators met the TRAI benchmark for all parameters during PMR as well as 3days live audit.

Wireless Data Services 2G & 3G

- All the operators met the benchmark as per PMR data as well as live measurement for Activation done within 4 hours except Airtel 2G and TATA GSM.
- All operators met the benchmark for drop rate as per audit as well as live data except Aircel 2G
- Aircel 3G and TATA3G failed to meet the benchmark for activation data for PMR.

Live Calling

- As per the consumers (live calling exercise) all operators failed to meet the benchmark only, TATA CDMA was able to meet the benchmark of resolving 98% complaints within 4 weeks.
- For the IVR aspect, all operators met the benchmark of 95% with all operators recording 100% for the parameter except idea.
- All operators failed to meet the TRAI benchmark for level 1 service.
- Aircel, Airtel, BSNL, Idea and Reliance GSM failed to meet the benchmark for Percentage of calls answered by the operators (Voice to Voice) within 90 seconds.

Metering and billing credibility

- For the billing disputes of post-paid subscribers, it was observed that Idea and Reliance GSM failed to meet the TRAI benchmark for the parameter.
- Airtel failed to meet the benchmark in complaints resolved in 6 weeks.
- Airtel failed to meet the benchmark for providing credit or waiver within one week in case of complaints received
- Reliance GSM did not meet the benchmark of answering 95% calls within 90 seconds

Drive Test (Operator Assisted) Voice 2G

- BSNL 2G failed to meet the benchmark in outdoor as well as indoor locations for Voice Quality in , Dewas, Indore, Seoni and Khargon SSA
- BSNL 2G failed to meet the benchmark in indoor locations for Voice Quality in Chhindwara and R SSA
- BSNL 2G failed to meet the benchmark for voice quality in Dewas, Khandwa, Ratlam, Panna, Raipur, Seoni and Raigarh SSA in outdoor location.
- BSNL 2G failed to meet the benchmark in outdoor as well as indoor locations for CSSR in Dewas SSA and outdoor location in Raipur and Raigarh SSA.
BSNL 2G failed to meet the benchmark in outdoor locations for call drop rate in Dewas, Indore, Khandwa, Khargaon, Ratlam, Panna, Seoni, Raigarh and Raipur SSA.

**Drive Test (Operator Assisted) Voice 3G**

- BSNL 3G failed to meet the benchmark in outdoor as well as indoor locations for Voice Quality in and Khargone SSA, however failed in outdoor locations in Khandwa, Raigarh and indoor location in Jabalpur, Chhindwara SSA.
- BSNL 3G failed to meet the benchmark for CSSR in outdoor location in Indore, Khargaoon SSA
- BSNL 3G failed to meet the benchmark for Call Drop Rate in outdoor location in Khandwa, Khargaon, Jabalpur and Panna, however failed in indoor location in Ratlam and Jabalpur SSA.
4 EXECUTIVE SUMMARY

The objective assessment of Quality of Service (QoS) carried out by IMRB gives an insight into the overall performance of various operators in the MPCG circle, with a parameter wise performance evaluation as compared to TRAI benchmark.

NA: SDCCH/ Paging channel congestion not applicable for CDMA operators.

Following are the parameter wise observations for wireless operators for MPCG circle:

**BTSs Accumulated Downtime:**

All operators met the benchmark. Minimum BTS Accumulated downtime was recorded for TATA GSM at 0.03%.

**Worst Affected BTSs Due to Downtime:**

All operators met the benchmark. Minimum worst affected BTSs due to downtime was recorded for Tata GSM at 0.01%.

**Call Set-up Success Rate (CSSR):**

All the operators met the benchmark for CSSR. The maximum CSSR was observed for Vodafone with 99.60%.

**SDCCH/ Paging Chl. Congestion:**

All operators met the benchmark on SDCCH / Paging Channel Congestion, while Airtel recorded the best SDCCH / Paging Channel Congestion at 0.06%.
TCH Congestion:

All the operators met the benchmark for TCH congestion, while Aircel performed the best on TCH congestion at 0.00%.

Call Drop Rate:

All the operators met the benchmark for the parameter. Minimum call drop rate was recorded for TATA CDMA at 0.19%.

Worst Affected Cells Having More than 3% TCH Drop:

Vodafone failed to meet the benchmark. Best performance was recorded for Reliance GSM at 0.76%.

Voice Quality

All operators met the benchmark. Best performance was recorded for TATA CDMA at 99.12%.

All the service providers were measuring this parameter as per the TRAI guidelines that have been stated in parameter description section.
Below are the month wise summary tables for each network parameter basis PMR data.

NA: SDCCH/ Paging channel congestion not applicable for CDMA operators.

BTSs Accumulated Downtime:

All the operators met the benchmark. Minimum BTS Accumulated downtime was recorded for Vodafone at 0.06%.

Worst Affected BTSs Due to Downtime:

All operators met the benchmark with Airtel TATA GSM recording 0.00% worst affected BTS due to downtime.

Call Set-up Success Rate (CSSR):

All operators met the benchmark for CSSR. The maximum CSSR was observed for vodafone with 99.52%.

SDCCH/ Paging Chl. Congestion:

All the operators met the benchmark on SDCCH / Paging Channel Congestion, while Airtel recorded the best SDCCH / Paging Channel Congestion at 0.07%.

TCH Congestion:

All the operators met the benchmark for TCH congestion, while Aircel performed the best with 0.00% TCH congestion.
Call Drop Rate:

All the operators met the benchmark for the parameter. Minimum call drop rate was recorded for Reliance GSM at 0.20%.

Worst Affected Cells Having More than 3% TCH Drop:

All the operators met the benchmark for the parameter. Best performance was recorded for Reliance GSM 0.70% and vodafone could not meet the benchmark.

Voice Quality

All operators met the benchmark. Best performance was recorded for TATA CDMA at 99.14%.

All the service providers were measuring this parameter as per the TRAI guidelines that have been stated in parameter description section.
Below are the month wise summary tables for each network parameter basis 3 day live data.

</table>

**Node Bs downtime:**
All operators met the benchmark. Best performance was recorded by Idea 3G with 0.09% downtime.

**Worst affected Node Bs due to downtime:**
All the operators met the benchmark. Minimum worst affected BTSs due to downtime was recorded for TATA 3G at 0.00%.

**Call Set-up Success Rate (CSSR):**
All the operators met the benchmark for CSSR. The maximum CSSR was observed for Airtel 3G with 99.83%.

**RRC Congestion:**
All the operators met the benchmark for RRC Congestion. The minimum RRC Congestion was observed for Airtel 3G with 0.01%.

**Circuit Switched RAB Congestion:**
All operators met the benchmark for the parameter. Minimum Circuit Switched RAB Congestion was recorded for Reliance 3G at 0.02%.

**Circuit Switched Voice Call Drop Rate:**
All operators met the benchmark for the parameter. Minimum call drop rate was recorded for Reliance 3G at 0.09%.

**Worst affected cells having more than 3% Circuit switched voice drop rate:**
All operators met the benchmark for the parameter. Best performance was recorded for Reliance 3G at 0.29%.

**Circuit Switch Voice Quality:**
All operators met the benchmark for the parameter. Best performance was recorded for Reliance 3G at 99.87%.

All the service providers were measuring this parameter as per the TRAI guidelines that have been stated in parameter description section.
Below are the month wise summary tables for each network parameter basis PMR data.

### 4.4 3 DAY DATA – CONSOLIDATED FOR 3G

A three day live measurement was conducted to measure the QoS provided by the operators. The table provided below gives a snapshot of the performance of all operators during live measurement.

<table>
<thead>
<tr>
<th>Name of Service Provider</th>
<th>Network Availability</th>
<th>Connection Establishment (Accessibility)</th>
<th>Connection Maintenance (Reliability)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Node Bs downtime (not available for service)</td>
<td>Worst affected Node Bs due to downtime</td>
<td>99</td>
</tr>
<tr>
<td>Airtel 3G</td>
<td>0.19%</td>
<td>0.00%</td>
<td>99.94%</td>
</tr>
<tr>
<td>BSNL 3G</td>
<td>1.61%</td>
<td>1.35%</td>
<td>97.34%</td>
</tr>
<tr>
<td>Idea 3G</td>
<td>0.68%</td>
<td>0.00%</td>
<td>99.68%</td>
</tr>
<tr>
<td>Reliance 3G</td>
<td>0.13%</td>
<td>0.38%</td>
<td>96.69%</td>
</tr>
<tr>
<td>Tata 3G</td>
<td>0.07%</td>
<td>0.00%</td>
<td>98.31%</td>
</tr>
</tbody>
</table>

**Node Bs downtime:**

All operators met the benchmark for the parameter. Best performance was recorded for TATA 3G at 0.07%.

**Worst affected Node Bs due to downtime:**

All the operators met the benchmark. Minimum worst affected BTSs due to downtime was recorded for Airtel 3G, Idea 3G and TATA 3G at 0.00%.

**Call Set-up Success Rate (CSSR):**

All the operators met the benchmark for CSSR. The maximum CSSR was observed for Airtel 3G with 99.84%.

**RRC Congestion:**

All the operators met the benchmark for RRC Congestion. The minimum RRC Congestion was observed for Airtel 3G with 0.01%.

**Circuit Switched RAB Congestion:**

All operators met the benchmark for the parameter. Minimum Circuit Switched RAB Congestion was recorded for Reliance 3G at 0.02%.

**Circuit Switched Voice Call Drop Rate:**

All operators met the benchmark for the parameter. Minimum call drop rate was recorded for Reliance 3G at 0.10%.

**Worst affected cells having more than 3% Circuit switched voice drop rate:**

All operators met the benchmark for the parameter. Best performance was recorded for Reliance 3G at 0.30%.

**Circuit Switch Voice Quality:**

All operators met the benchmark for the parameter. Best performance was recorded for Reliance 3G at 99.87%.

All the service providers were measuring this parameter as per the TRAI guidelines that have been stated in parameter description section.
Below are the month wise summary tables for each network parameter basis 3 day live data.

### 4.4.1 3 DAY DATA - JULY FOR 3G

NDR: No data received from operators

Following are the parameter wise observations for wireless operators for MPCG circle:

**Activation done within 4 hours:**

All the operators met the benchmark as per PMR data as well as live measurement for Activation done within 4 hours except Airtel and TATA GSM. Aircel and Vodafone showed best performance.

**PDP Context activation success rate:**

All operators met the benchmark for PDP context activation success rate for as per audit as well as live measurement. Maximum PDP Context activation success rate was recorded for TATA GSM for PMR as well as Live data.

**Drop Rate:**

All operators met the benchmark for drop rate as per audit as well as live data except Aircel.

</tbody>
</table>

NDR: No data received

Following are the parameter wise observations for wireless operators for MPCG circle:

**Activation done within 4 hours:**

Aircel 3G and TATA3G failed to meet the benchmark for activation data for PMR with Reliance 3G showing best performance.

**PDP Context activation success rate:**

All operators met the benchmark for PDP context activation success rate for TATA 3G performing best for PMR data and Airtel 3G for Live data.

**Drop Rate:**

All operators met the benchmark for drop rate as per audit as well as live measurement with Airtel 3G performing best for both PMR and Live data.
Below are the month wise summary tables for each network parameter basis PMR and Live data.

### 4.7 LIVE CALLING DATA - CONSOLIDATED

</tr>
</tbody>
</table>

NA- Not applicable

**Resolution of billing complaints**

As per the consumers (live calling exercise) no operator could meet the benchmark of resolving 98% complaints within 4 weeks.

The benchmark for resolving 100% complaints within 6 weeks was achieved by all operators.

**Accessibility of Call Centre/Customer Care-IVR**

For the IVR aspect, all operators met the benchmark of 95% with all operators recording 100% for the parameter except idea.

**Customer Care / Helpline Assessment (voice to voice)**

TATA CDMA, TATA GSM and Vodafone met the benchmark of answering 95% voice to voice calls within 90 seconds.

**Level 1 Service**

As per the live calling results, all operators failed to meet the TRAI benchmark for level 1 service.

**Complaint/Request Attended to Satisfaction**

All operators performed satisfactorily in terms of satisfaction of the customers for service requests. Airtel showed best performance with 92%.
4.8 BILLING AND CUSTOMER CARE - CONSOLIDATED

</table>

Metering and Billing Credibility – Post-paid Subscribers

For the billing disputes of post-paid subscribers, it was observed that Idea and Reliance GSM failed to meet the TRAI benchmark for the parameter. Aircel and Tata GSM & CDMA had the best performance with 0.00% billing disputes.

Metering and Billing Credibility – Prepaid Subscribers

For the prepaid customers, Idea failed to meet the benchmark of charging disputes. Aircel, Tata CDMA and GSM performed the best with 0.00% disputes.

Resolution of billing complaints

All operators met the TRAI benchmark of resolution of billing complaints within 4 weeks and 6 weeks respectively except Airtel in complaints resolved in 6 weeks.

Response Time to customer for assistance - % of cases in which advance waiver is received within one week

All the operators met the TRAI benchmark of providing credit or waiver within one week in case of complaints received except Vodafone.

Customer Care Percentage of calls answered by the IVR

All the operators met the TRAI benchmark of answering 95% IVR calls except Airtel.

Customer Care Percentage of calls answered by the operators (Voice to Voice) within 90 seconds

Reliance GSM did not meet the benchmark of answering 95% calls within 90 seconds.

Value calculated by Operator and IMRB match

Value calculated by Operator and IMRB do not match
5 CRITICAL FINDINGS

PMR and 3day live consolidated 2G (Network Parameters)

- Vodafone failed to meet the benchmark for Worst Affected Cells having more than 3% TCH drop during PMR audit.

PMR and 3Days live consolidated 3G (Network Parameters)

- All operators met the TRAI benchmark for all parameters during PMR as well as 3days live audit.

Wireless Data Services 2G & 3G

- All the operators met the benchmark as per PMR data as well as live measurement for Activation done within 4 hours except Airtel 2G and TATA GSM.
- All operators met the benchmark for drop rate as per audit as well as live data except Aircel 2G
- Aircel 3G and TATA3G failed to meet the benchmark for activation data for PMR.

Live Calling

- As per the consumers (live calling exercise) all operators failed to meet the benchmark only, TATA CDMA was able to meet the benchmark of resolving 98% complaints within 4 weeks.
- For the IVR aspect, all operators met the benchmark of 95% with all operators recording 100% for the parameter except idea.
- All operators failed to meet the TRAI benchmark for level 1 service.
- Aircel, Airtel, BSNL, Idea and Reliance GSM failed to meet the benchmark for Percentage of calls answered by the operators (Voice to Voice) within 90 seconds.

Metering and billing credibility

- For the billing disputes of post-paid subscribers, it was observed that Idea and Reliance GSM failed to meet the TRAI benchmark for the parameter.
- Airtel failed to meet the benchmark in complaints resolved in 6 weeks.
- Airtel failed to meet the benchmark for providing credit or waiver within one week in case of complaints received.
- Reliance GSM did not meet the benchmark of answering 95% calls within 90 seconds.

Drive Test (Operator Assisted) Voice 2G

- BSNL 2G failed to meet the benchmark in outdoor as well as indoor locations for Voice Quality in , Dewas, Indore, Seoni and Khargon SSA
- BSNL 2G failed to meet the benchmark in indoor locations for Voice Quality in Chhindwara and R SSA
- BSNL 2G failed to meet the benchmark for voice quality in Dewas, Khandwa, Ratlam, Panna, Raipur, Seoni and Raigarh SSA in outdoor location.
BSNL 2G failed to meet the benchmark in outdoor as well as indoor locations for CSSR in Dewas SSA and outdoor location in Raipur and Raigarh SSA.

BSNL 2G failed to meet the benchmark in outdoor locations for call drop rate in Dewas, Indore, Khandwa, Khargao, Ratlam, Panna, Seoni, Raigarh and Raipur SSA.

**Drive Test (Operator Assisted) Voice 3G**

BSNL 3G failed to meet the benchmark in outdoor as well as indoor locations for Voice Quality in and Khargone SSA, however failed in outdoor locations in Khandwa, Raigarh and indoor location in Jabalpur, Chhindwara SSA.

BSNL 3G failed to meet the benchmark for CSSR in outdoor location in Indore, Khargaon SSA

BSNL 3G failed to meet the benchmark for Call Drop Rate in outdoor location in Khandwa, Khargaon, Jabalpur and Panna, however failed in indoor location in Ratlam and Jabalpur SSA.
6 PARAMETER DESCRIPTION & DETAILED FINDINGS - COMPARISON BETWEEN PMR DATA, 3 DAY LIVE DATA AND LIVE CALLING DATA FOR 2G

6.1 BTS ACCUMULATED DOWNTIME

6.1.1 PARAMETER DESCRIPTION

The parameter of network availability would be measured from the following sub-parameters:

1. BTSs Accumulated downtime (not available for service)
2. Worst affected BTSs due to downtime

1. Definition - BTSs (Base Transceiver Station) accumulated downtime (not available for service) shall basically measure the downtime of the BTSs, including its transmission links/circuits during the period of a month, but excludes all planned service downtime for any maintenance or software upgradation. For measuring the performance against the benchmark for this parameter the downtime of each BTS lasting more than 1 hour at a time in a day during the period of a month were considered.

2. Computation Methodology –

\[
\text{BTS accumulated downtime (not available for service)} = \frac{\text{Sum of downtime of BTSs in a month in hours}}{\text{(24 x Number of days in a month x Number of BTSs in the network in licensed service area) x 100}}
\]

3. TRAI Benchmark –

a. BTSs Accumulated downtime (not available for service) ≤ 2%

4. Audit Procedure –

- The fault alarm details at the OMC (MSC) for the network outages (due to own network elements and infrastructure service provider end outages) were audited.
- All the BTS in service area were considered. Planned outages due to network upgradation, routine maintenance were not considered.
Any outage as a result of force majeure were not considered at the time of calculation.

Data is extracted from system log of the server of the operator. This data is in raw format which is further processed to arrive at the cumulative values.

List of operating sites with cell details and ids are taken from the operator.

When there is any outage a performance report gets generated in line with that cell resulting and master base of the Accumulated downtime and worst affected BTS due to downtime.

### 6.1.2 KEY FINDINGS - CONSOLIDATED

**BTSs accumulated downtime - Consolidated**

BTSs accumulated downtime - Month 3

Data Source: Operations and Maintenance Center (OMC) of the operators
6.2 WORST AFFECTED BTS DUE TO DOWNTIME

6.2.1 PARAMETER DESCRIPTION

- **Definition – Worst Affected BTS due to downtime** shall basically measure percentage of BTS having downtime greater than 24 hours in a month. Planned outages were not considered as part while computing.

For measuring the parameter “Percentage of worst affected BTSs due to downtime” the downtime of each BTS lasting for more than 1 hour at a time in a day during the period of a month was considered.

- **Computation Methodology –**

  \[
  \text{Worst affected BTSs due to downtime} = \left( \frac{\text{Number of BTSs having accumulated downtime greater than 24 hours in a month}}{\text{Number of BTS in Licensed Service Area}} \right) \times 100
  \]

- **TRAI Benchmark –**
  
  a. Worst affected BTSs due to downtime ≤ 2%

- **Audit Procedure –**
  
  i. The fault alarm details at the OMC (MSC) for the network outages (due to own network elements and infrastructure service provider end outages) was audited

  ii. All the BTS in service area were considered. Planned outages due to network upgradation, routine maintenance were not considered.

  iii. Data is extracted from system log of the server of the operator. This data is in raw format which is further processed to arrive at the cumulative values.

  iv. Any outage as a result of force majeure was not considered at the time of calculation.

  v. List of operating sites with cell details and ids are taken from the operator.

  vi. All the BTS having down time greater than 24 hours is assessed and values of BTS accumulated downtime is computed in accordance.

6.3 CALL SET UP SUCCESS RATE

6.3.1 PARAMETER DESCRIPTION

1. **Definition:** The ratio of successful calls established to total calls is known as Call Set-Up Success Rate (CSSR).

2. **Computation Methodology**-
   \[
   \text{CSSR} = \frac{\text{Calls Established}}{\text{Total Call Attempts}} \times 100
   \]
   Call Established means the following events have happened in call setup:-
   - call attempt is made
   - the TCH is allocated
   - the call is routed to the outward path of the concerned MSC

3. **TRAI Benchmark ≥ 95\%**

4. **Audit Procedure** –
   - The cell-wise data generated through counters/MMC available in the switch for traffic measurements
   - CSSR calculation should be measured using OMC generated data only
   - Measurement should be only in Time Consistent Busy Hour (CBBH) period for all days of the week
   - Counter data is extracted from the NOC of the operators.
   - Total calls established include all calls established excluding Signaling blocking, TCH Drop and TCH blocking.
   - The numerator and denominator values are derived from adding the counter values from the MSC.
6.3.2  KEY FINDINGS - CONSOLIDATED

Data Source: Network Operations Center (NOC) of the operators
6.4 NETWORK CHANNEL CONGESTION- PAGING CHANNEL /TCH CONGESTION/POI

6.4.1 PARAMETER DESCRIPTION

1. **Definition:** It means a call is not connected because there is no free channel to serve the call attempt. This parameter represents congestion in the network. It happens at three levels:

   - SDCCH Level: Stand-alone dedicated control channel
   - TCH Level: Traffic Channel
   - POI Level: Point of Interconnect

2. **Computational Methodology:**

   - **SDCCH / TCH Congestion%** = \[\frac{(A_1 \times C_1) + (A_2 \times C_2) + \ldots + (A_n \times C_n)}{A_1 + A_2 + \ldots + A_n}\]
     - Where:\n       - \(A_1\) = Number of attempts to establish SDCCH / TCH made on day 1
       - \(C_1\) = Average SDCCH / TCH Congestion % on day 1
       - \(A_2\) = Number of attempts to establish SDCCH / TCH made on day 2
       - \(C_2\) = Average SDCCH / TCH Congestion % on day 2
       - \(A_n\) = Number of attempts to establish SDCCH / TCH made on day \(n\)
       - \(C_n\) = Average SDCCH / TCH Congestion % on day \(n\)

   - **POI Congestion%** = \[\frac{(A_1 \times C_1) + (A_2 \times C_2) + \ldots + (A_n \times C_n)}{A_1 + A_2 + \ldots + A_n}\]
     - Where:\n       - \(A_1\) = POI traffic offered on all POIs (no. of calls) on day 1
       - \(C_1\) = Average POI Congestion % on day 1
       - \(A_2\) = POI traffic offered on all POIs (no. of calls) on day 2
       - \(C_2\) = Average POI Congestion % on day 2
3. **Benchmark:**
   - SDCCH Congestion: ≤ 1%, TCH Congestion: ≤ 2%, POI Congestion: ≤ 0.5%

4. **Audit Procedure** –
   - Audit of the details of SDCCH and TCH congestion percentages computed by the operator (using OMC-Switch data only) would be conducted
   - The operator should be measuring this parameter during Time consistent busy hour (TCBH) only for SDCCH

*Data Source: Network Operations Center (NOC) of the operators*
6.5 CALL DROP RATE

6.5.1 PARAMETER DESCRIPTION

1. **Definition** - The dropped call rate is the ratio of successfully originated calls that were found to drop to the total number of successfully originated calls that were correctly released.
   - **Total calls dropped** = All calls ceasing unnaturally i.e. due to handover or due to radio loss
   - **Total calls established** = All calls that have TCH allocation during busy hour

2. **Computational Methodology**: \( \frac{\text{Total Calls Dropped}}{\text{Total Calls Established}} \times 100 \)

3. **TRAI Benchmark** –
   - Call drop rate ≤ 2%

4. **Audit Procedure** –
   - Audit of traffic data of the relevant quarter kept in OMC-R at MSCs and used for arriving at CDR was used
   - The operator should only be considering those calls which are dropped during Time consistent busy hour (TCBH) for all days of the relevant quarter.
6.5.2 KEY FINDINGS - CONSOLIDATED

All operators met the benchmark for call drop rate during audit.

6.5.2.1 KEY FINDINGS – MONTH 1

Call Drop Rate - Month 3

TRAI Benchmark ≤ 2%

Data Source: Network Operations Center (NOC) of the operators
**6.6 CELLS HAVING GREATER THAN 3% TCH DROP**

**6.6.1 PARAMETER DESCRIPTION**

1. **Definition** - *Worst Affected Cells having more than 3% TCH drop* shall measure the ratio of total number of cells in the network to the ratio of cells having more than 3% TCH drop.

2. **Computational Methodology**: \( \frac{\text{Total number of cells having more than 3% TCH drop during CBBH}}{\text{Total number of cells in the network}} \times 100 \)

3. **TRAI Benchmark** – Worst affected cells having more than 3% TCH drop rate ≤ 3%

4. **Audit Procedure** – Audit of traffic data of the relevant quarter kept in OMC-R at MSCs and used for arriving at CDR would be conducted.

The operator should only be considering those calls which are dropped during Cell Bouncing Busy hour (CBBH) for all days of the relevant quarter.

**6.6.2 KEY FINDINGS - CONSOLIDATED**

**Data Source:** Network Operations Center (NOC) of the operators
6.7 **VOICE QUALITY**

6.7.1 **PARAMETER DESCRIPTION**

1. **Definition:**
   - for GSM service providers the calls having a value of 0 – 5 are considered to be of good quality (on a seven point scale)
   - For CDMA the measure of voice quality is Frame Error Rate (FER). FER is the probability that a transmitted frame will be received incorrectly. Good voice quality of a call is considered when it FER value lies between 0 – 4 %

2. **Computational Methodology:**
   - % Connections with good voice quality = (No. of voice samples with good voice quality / Total number of samples) x 100

3. **TRAI Benchmark:** ≥ 95%

4. **Audit Procedure** –
   a. A sample of calls would be taken randomly from the total calls established.
   b. The operator should only be considering those calls which are meeting the desired benchmark of good voice quality.
6.7.2 KEY FINDINGS

All operators met the benchmark for the parameter as per audit data. During drive test BSNL failed to meet the TRAI benchmark.

**PMR Data** | **Live Data** | **Drive Test Data**

*Data Source: Network Operations Center (NOC) of the operators*
7 PARAMETER DESCRIPTION & DETAILED FINDINGS - COMPARISON BETWEEN PMR DATA, 3 DAY LIVE DATA AND LIVE CALLING DATA FOR 3G

7.1 NODE BS DOWNTIME

7.1.1 PARAMETER DESCRIPTION

- The parameter of network availability would be measured from following sub-parameters

  1. Node Bs downtime (not available for service)
  2. Worst affected Node Bs due to downtime

- **Definition - Node Bs downtime (not available for service):** In the case of 3G networks, instead of BTS the nomenclature is Node B. The measurement methodology for the parameter Node B Accumulated downtime (not available for service) will be similar to the existing parameter for BTSs Accumulated downtime (not available for service).

- **Data Extraction/collection methodology** - Data extraction to be done from appropriate counters. Auditors should be aware of counter details and definitions for each operator.

- **Source of Data:** Network Operation Center (NOC) or a Central Server

- **Computation Methodology** –

  \[
  \text{Node Bs downtime (not available for service)} = \frac{\text{Sum of downtime of Node Bs in a month in hours i.e. total outage time of all Node Bs in hours during a month}}{24 \times \text{Number of days in a month} \times \text{Number of Node Bs in the network in licensed service area}} \times 100
  \]

  3. **TRAI Benchmark** –

  a. Node Bs downtime (not available for service) ≤ 2%

  4. **Audit Procedure** –

    - The fault alarm details at the OMC (MSC) for the network outages (due to own network elements and infrastructure service provider end outages) was audited
All the Node Bs in service area was considered. Planned outages due to network upgradation, routine maintenance were not considered.

Any outage as a result of force majeure were not considered at the time of calculation.

Data is extracted from system log of the server of the operator. This data is in raw format which is further processed to arrive at the cumulative values.

List of operating sites with cell details and ids are taken from the operator.

When there is any outage a performance report gets generated in line with that cell resulting and master base of the Node Bs downtime and worst affected Node Bs due to downtime.

TRAI Benchmark ≤ 2%
7.2 WORST AFFECTED NODE BS DUE TO DOWNTIME

7.2.1 PARAMETER DESCRIPTION

- **Definition –** Worst Affected Node Bs due to downtime shall basically measure percentage of Node Bs having downtime greater than 24 hours in a month. Planned outages were not considered as part while computing. For measuring the parameter "Percentage of worst affected Node Bs due to downtime" the downtime of each Node B lasting for more than 1 hour at a time in a day during the period of a month was considered.

- **Computation Methodology –** Worst affected Node Bs due to downtime = \( \frac{\text{Number of Node Bs having accumulated downtime greater than 24 hours in a month}}{\text{Number of Node Bs in Licensed Service Area}} \) * 100

- **TRAI Benchmark –**
  - b. Worst affected Node Bss due to downtime ≤ 2%

- **Audit Procedure –**
  - i. The fault alarm details at the OMC (MSC) for the network outages (due to own network elements and infrastructure service provider end outages) was audited
  - ii. All the Node Bs in service area were considered. Planned outages due to network upgradation, routine maintenance were not considered.
  - iii. Data is extracted from system log of the server of the operator. This data is in raw format which is further processed to arrive at the cumulative values.
  - iv. Any outage as a result of force majeure was not considered at the time of calculation.
  - v. List of operating sites with cell details and ids are taken from the operator.
  - vi. All the Node Bs having down time greater than 24 hours is assessed and values of Node Bs accumulated downtime is computed in accordance.

Data Source: Operations and Maintenance Center (OMC) of the operators
7.3 CALL SET UP SUCCESS RATE

7.3.1 PARAMETER DESCRIPTION

1. **Definition:** This parameter is same for 2G Networks as well as 3G Networks. However, the network elements involved in both the networks are different. Call Set-up Success Rate is defined as the ratio of Established Calls to Call Attempts. For establishing a call in 3G Networks, User Equipment (UE) accesses the Universal Terrestrial Radio Access Network (UTRAN) and establishes an RRC connection. Once RRC connection is established the Non Access Stratum (NAS) messages are exchanged between the UE and the Core Network (CN). The last step of the call setup is the establishment of a Radio Access Bearer (RAB) between the CN and the UE. However, any RAB abnormal release after RAB Assignment Response or Alerting/Connect message is to be considered as a dropped call.

2. **Data Extraction/collection methodology** - Data extraction to be done from appropriate counters. Auditors should be aware of counter details and definitions for each operator.

3. **Source of Data:** Network Operation Center (NOC) or a Central Server

4. **Computation Methodology** -
   \[
   \text{Call Set-up Success Rate} = \frac{\text{RRC Established}}{\text{Total RRC Attempts}} \times 100
   \]
   RRC Established means the following events have happened in RRC setup:
   - RRC attempt is made
   - The RRC established
   - The RRC is routed to the outward path of the concerned MSC

5. **TRAI Benchmark** ≥ 95%

6. **Audit Procedure** –
   - The cell-wise data generated through counters/ MMC available in the switch for traffic measurements
CSSR calculation should be measured using OMC generated data only

Measurement should be only in Time Consistent Busy Hour (CBBH) period for all days of the week

Counter data is extracted from the NOC of the operators.

Total calls established include all calls established excluding RAB congestion.

The numerator and denominator values are derived from adding the counter values from the MSC.

### 7.3.2 KEY FINDINGS - CONSOLIDATED

![Call Set Up Success Rate - Consolidated](image)

Data Source: Network Operations Center (NOC) of the operators

All the operators met the benchmark for the parameter as per PMR and Live data.

7.4 NETWORK CHANNEL CONGESTION- RRC CONGESTION/ CIRCUIT SWITCHED RAB CONGESTION

7.4.1 PARAMETER DESCRIPTION

1. **Definition (RRC Congestion):** This parameter has been amended to include RRC Congestion in 3G Networks.
2. **Definition (Circuit Switched RAB congestion):** Circuit Switched RAB congestion is similar to Traffic Channel Congestion. Therefore, the existing parameter has been amended to include RAB congestion in 3G Networks.
3. **Point of Interconnection (POI) Congestion:** This parameter denotes congestion at the outgoing traffic between two networks and is equally applicable for 2G networks and 3G networks.
   - RRC Level: Stand-alone dedicated control channel
   - RAB Level: Traffic Channel
   - POI Level: Point of Interconnect
4. **Data Extraction/collection methodology** - Data extraction to be done from appropriate counters. Auditors should be aware of counter details and definitions for each operator.
5. **Source of Data:** Network Operation Center (NOC) or a Central Server
6. **Computational Methodology:**

   \[
   \text{RRC} / \text{RAB Congestion}\% = \frac{[(A_1 \times C_1) + (A_2 \times C_2) + \ldots + (A_n \times C_n)]}{(A_1 + A_2 + \ldots + A_n)}
   \]
   - Where: \(A_1 = \) Number of attempts to establish RRC/ RAB made on day 1
   - \(C_1 = \) Average RRC / RAB Congestion % on day 1
   - \(A_2 = \) Number of attempts to establish RRC / RAB made on day 2
   - \(C_2 = \) Average RRC / RAB Congestion % on day 2
   - \(A_n = \) Number of attempts to establish RRC / RAB made on day \(n\)
   - \(C_n = \) Average RRC / RAB Congestion % on day \(n\)
POI Congestion\% = \left[ \frac{(A_1 \times C_1) + (A_2 \times C_2) + \ldots + (A_n \times C_n)}{(A_1 + A_2 + \ldots + A_n)} \right]

- Where: 
  - $A_1 =$ POI traffic offered on all POIs (no. of calls) on day 1
  - $C_1 =$ Average POI Congestion \% on day 1
  - $A_2 =$ POI traffic offered on all POIs (no. of calls) on day 2
  - $C_2 =$ Average POI Congestion \% on day 2
  - $A_n =$ POI traffic offered on all POIs (no. of calls) on day n
  - $C_n =$ Average POI Congestion \% on day n

7. Benchmark:

- RRC Congestion: $\leq 1\%$, RAB Congestion: $\leq 2\%$, POI Congestion: $\leq 0.5\%$

8. Audit Procedure –

- Audit of the details of RRC and RAB congestion percentages computed by the operator (using OMC–Switch data only) would be conducted
  - The operator should be measuring this parameter during Time consistent busy hour (TCBH) only RRC
7.4.2  KEY FINDINGS - RRC CONGESTION (CONSOLIDATED)

*Data Source: Network Operations Center (NOC) of the operators*
7.5 CIRCUIT SWITCHED VOICE DROP RATE

7.5.1 PARAMETER DESCRIPTION

1. **Definition** - The Call Drop Rate measures the inability of Network to maintain a call and is defined as the ratio of abnormal speech disconnects with respect to all speech disconnects (both normal and abnormal). In 3G Networks, a normal disconnect is initiated from the Mobile Switching Centre (MSC) at completion of the call by a RAB Disconnect message. An abnormal RAB disconnect can be initiated by either UTRAN or CN and includes Radio Link Failures, Uplink (UL) or Downlink (DL) interference or any other reason.

   - **Total No. of voice RAB abnormally released** = All calls ceasing unnaturally i.e. due to handover or due to radio loss
   - **No. of voice RAB normally released** = All calls that have RAB allocation during busy hour

2. **Data Extraction/collection methodology** - Data extraction to be done from appropriate counters. Auditors should be aware of counter details and definitions for each operator.

3. **Source of Data**: Network Operation Center (NOC) or a Central Server

4. **Computational Methodology**: \( \frac{\text{No. of voice RAB normally released}}{\text{No. of voice RAB normally released} + \text{RAB abnormally released}} \times 100 \)

<table>
<thead>
<tr>
<th>Key Performance Indicator Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>#RAB Normal Release(CSV)</td>
<td>Number of voice RAB normally Released</td>
</tr>
<tr>
<td>#RAB Abnormal Release(CSV)</td>
<td>Number of voice RAB abnormally Released</td>
</tr>
</tbody>
</table>

5. **TRAI Benchmark** -

   - Circuit switched voice drop rate ≤ 2%

6. **Audit Procedure** –

   - Audit of traffic data of the relevant quarter kept in OMC-R at MSCs and used for arriving at CDR was used
   - The operator should only be considering those calls which are dropped during Time consistent busy hour (TCBH) for all days of the relevant quarter.
7.5.2  KEY FINDINGS - CONSOLIDATED

Call Drop Rate - Consolidated

Data Source: Network Operations Center (NOC) of the operators

All operators met the benchmark for call drop rate during audit. BSNL failed to meet the benchmark during drive Test Data.

7.5.2.3 KEY FINDINGS – MONTH 3

Call Drop Rate-Month 3

TRAI Benchmark ≤ 2%

Data Source: Network Operations Center (NOC) of the operators
7.6 WORST AFFECTED CELLS HAVING MORE THAN 3% CIRCUIT SWITCHED VOICE DROP RATE

7.6.1 PARAMETER DESCRIPTION

1. **Definition - Cells having more than 3% circuit switch voice quality:** The existing parameter has been amended to cover 3G Networks to assess worst affected cells having more than 3% CSV Drop Rate.

2. **Data Extraction/collection methodology** - Data extraction to be done from appropriate counters. Auditors should be aware of counter details and definitions for each operator.

3. **Source of Data:** Network Operation Center (NOC) or a Central Server

4. **Computational Methodology:** \[
\text{(Number of cells having CSV drop rate > 3\% during CBBH in a month / Total number of cells in the licensed area) } \times 100
\]

5. **TRAI Benchmark** –
   - Worst affected cells having CSV drop rate > 3\% during CBBH in a month ≤ 3\%

6. **Audit Procedure** –
   - Audit of traffic data of the relevant quarter kept in OMC-R at MSCs and used for arriving at CDR would be conducted.

   The operator should only be considering those calls which are dropped during Cell Bouncing Busy hour (CBBH) for all days of the relevant quarter.
7.6.2 KEY FINDINGS - CONSOLIDATED

All operators met the benchmark during audit for live calling.

7.6.2.1 KEY FINDINGS – MONTH 1

Data Source: Network Operations Center (NOC) of the operators

7.7 CIRCUIT SWITCH VOICE QUALITY

7.7.1 PARAMETER DESCRIPTION

5. Definition:

- For GSM service providers the calls having a value of 0 – 5 are considered to be of good quality (on a seven point scale).
- For CDMA the measure of voice quality is Frame Error Rate (FER). FER is the probability that a transmitted frame will be received incorrectly. Good voice quality of a call is considered when it FER value lies between 0 – 4 %.

6. Computational Methodology:

\[ \% \text{Connections with good voice quality} = \left( \frac{\text{No. of voice samples with good voice quality}}{\text{Total number of samples}} \right) \times 100 \]

7. TRAI Benchmark: ≥ 95%

8. Audit Procedure –

a. A sample of calls would be taken randomly from the total calls established.

b. The operator should only be considering those calls which are meeting the desired benchmark of good voice quality.
7.7.2 KEY FINDINGS

All the operators met the benchmark for the parameter as per PMR and Live data. BSNL 3G failed to meet the benchmark during drive test.

8.1 SERVICE ACTIVATION /PROVISIONING FOR 2G & 3G

8.1.1 PARAMETER DESCRIPTION

This refers to the activation of services after activation of the SIM. This involves programming the various databases with the customer's information and any gateways to standard Internet chat or mail services or any data services. The service provider typically sends these settings to the subscriber's handset using SMS or WAP.

\[
\text{% activation done within 4 hours} = \frac{\text{Total Time Taken for Activation}}{\text{Total request time made}} \times 100
\]
8.1.2 KEY FINDINGS 2G

Airtel failed to meet the benchmark for Activation done for 4 hours during PMR audit.
8.1.3 KEY FINDINGS 3G

Activation done within 4 hours - Consolidated

<table>

</tbody>
</table>

TRAI Benchmark ≥ 95%

Data Source: Network Operations Center (NOC) of the operators

All operators met the benchmark for activation done within 4 hours during audit. Airtel & TATA failed to meet the benchmark for PMR Data.
8.2 PDP CONTEXT ACTIVATION SUCCESS RATE FOR 2G & 3G

8.2.1 PARAMETER DESCRIPTION

A Packet Data Protocol (PDP) context specifies access to an external packet-switching network. The data associated with the PDP context contains information such as the type of packet-switching network, the Mobile Station PDP (MS PDP) address that is the IP address, the reference of Gateway GPRS Support Node (GGSN), and the requested QoS. A PDP context is handled by the MS, Serving GPRS Support Node (SGSN) and GGSN and is identified by a mobile's PDP address within these entities. Several PDP contexts can be activated at the same time within a given MS.

Measurement

This measurement provides the number of successfully completed PDP context activations. For these context activations, the GGSN is updated successfully and a report of PDP context activation success is generated at GGSN.

\[
PDP\ Context\ Activation\ Success\ Rate\ (%) = \frac{\text{Number of successfully completed PDP context activations}}{\text{Total attempts of context activation}} \times 100
\]
8.2.2 KEY FINDINGS 2G

All operators met the benchmark for PDP context activation success rate during audit.

8.2.3 KEY FINDINGS 3G

All operators met the benchmark for PDP context activation success rate during audit.
8.3 DROP RATE FOR 2G & 3G

8.3.1 PARAMETER DESCRIPTION

It measures the inability of Network to maintain a connection and is defined as the ratio of abnormal disconnects w.r.t. all disconnects (both normal and abnormal). An abnormal disconnect may happen because of Radio Link Failures, Uplink (UL) or Downlink (DL) interference, bad coverage, unsuccessful handovers or any other reason. The drop rate is to be measured for all generations of the technologies separately.

\[
\text{Drop rate} = \frac{\text{No. of Dropped data Calls}}{\text{No. of Successful data calls}} \times 100
\]
8.3.2 KEY FINDINGS 2G

All operators met the benchmark for drop rate during audit Aircel failed to meet the benchmark for live data.

8.3.3 KEY FINDINGS 3G

All operators met the benchmark for drop rate during audit.
9 PARAMETER DESCRIPTION AND DETAILED FINDINGS – NON-NETWORK PARAMETERS

9.1 METERING AND BILLING CREDIBILITY

The billing complaints for postpaid are calculated by averaging over one billing cycle in a quarter. For example, there are three billing cycles in a quarter, the data for each billing cycle is calculated separately and then averaged over.

The charging complaints for prepaid are calculated by taking all complaints in a quarter.

9.1.1 PARAMETER DESCRIPTION

All the complaints related to billing/charging as per clause 3.7.2 of QoS regulation of 20th December, 2009 were covered. The types of billing complaints covered are listed below.

- Payments made and not credited to the subscriber account
- Payment made on time but late payment charge levied wrongly
- Wrong roaming charges
- Double charges
- Charging for toll free services
- Local calls charged/billed as STD/ISD or vice versa
- Calls or messages made disputed
- Validity related complaints
- Credit agreed to be given in resolution of complaint, but not accounted in the bill
- Charging for services provided without consent
- Charging not as per tariff plans or top up vouchers/ special packs etc.
- Overcharging or undercharging
In addition to the above, any billing complaint which leads to billing error, waiver, refund, credit, or any adjustment is also considered as valid billing complaint for calculating the number of disputed bills.

- **Computational Methodology:**
  
  **Billing complaints per 100 bills issued (Postpaid)** = \( \frac{\text{Total billing complaints}^{**} \text{ received during the relevant billing cycle}}{\text{Total bills generated}^{*} \text{ during the relevant billing cycle}} \times 100 \)

  *Operator to include all types of bills generated for customers. This would include printed bills, online bills and any other forms of bills generated

  **Billing complaints here shall include only dispute related issues (including those that may arise because of a lack of awareness at the subscribers’ end). It does not include any provisional issues (such as delayed dispatch of billing statements, etc.) in which the operator has opened a ticket internally.

  **Charging complaints per 100 subscribers (Prepaid)** = \( \frac{\text{Total charging complaints received during the quarter}}{\text{Total number of subscribers reported by the operator at the end of the quarter}} \times 100 \)

- **TRAI Benchmark:** \( \leq 0.1\% \)

- **Audit Procedure:**
  
  Audit of billing complaint details for the complaints received during the quarter and used for arriving at the benchmark reported to TRAI would be conducted

  - For Postpaid, the total billing complaints would be audited by averaging over billing cycles in a quarter
  - For Prepaid, the data of total charging complaints in a quarter would be taken for the purpose of audit
9.1.2  KEY FINDINGS – METERING AND BILLING CREDIBILITY (POSTPAID)

Idea and Reliance GSM failed to meet the benchmark of 0.1% post-paid metering and billing credibility.
9.1.3 KEY FINDINGS - METERING AND BILLING CREDIBILITY (PREPAID)

Metering and billing credibility - Prepaid

Data Source: Billing Center of the operators

All operators meet the benchmark of 0.1% prepaid metering & billing credibility.
9.2 RESOLUTION OF BILLING/ CHARGING COMPLAINTS

9.2.1 PARAMETER DESCRIPTION

Calculation of Percentage resolution of billing complaints

The calculation methodology (given below) as per QoS regulations 2009 (7 of 2009) was followed to calculate resolution of billing complaints.

Resolution of billing complaints within 4 weeks:

\[
\text{%age of billing complaints (for post-paid customers)}/ \text{charging, credit & validity (for pre-paid customers) resolved within 4 weeks} = \frac{\text{number of billing complaints for post-paid customers/charging, credit/ validity complaints for pre-paid customers resolved within 4 weeks during the quarter}}{\text{number of billing/charging, credit / validity complaints received during the quarter}} \times 100
\]

Resolution of billing complaints within 6 weeks:

\[
\text{%age of billing complaints (for post-paid customers)}/ \text{charging, credit & validity (for pre-paid customers) resolved within 6 weeks} = \frac{\text{number of billing complaints for post-paid customers/charging, credit/ validity complaints for pre-paid customers resolved within 6 weeks during the quarter}}{\text{number of billing/charging, credit / validity complaints received during the quarter}} \times 100
\]

**Billing complaints here shall include only dispute related issues (including those that may arise because of a lack of awareness at the subscribers’ end). It does not include any provisional issues (such as delayed dispatch of billing statements, etc.) in which the operator has opened a ticket internally. Complaints raised by the consumers to operator are only considered as part of the calculation.**
The complaints that get marked as invalid by the operator are not considered for calculation as those complaints cannot be considered as resolved by the operator.

*** Date of resolution in this case would refer to the date when a communication has taken place from the operator's end to inform the complainant about the final resolution of the issue / dispute.

Benchmark: 98% complaints resolved within 4 weeks, 100% within 6 weeks.

### 9.2.2 KEY FINDINGS - WITHIN 4 WEEKS

</table>

TRAI Benchmark = 98%

As per the consumers (live calling exercise) Airtel, BSNL, Reliance GSM, Vodafone and Idea failed to meet the benchmark for Percentage cases resolved in 4 weeks during live Calling and all operators meet the benchmark for Percentage cases resolved in 4 weeks during quarterly audit results.
9.2.3 KEY FINDINGS WITHIN 6 WEEKS

The benchmark for resolving 100% complaints within 6 weeks was not met by all operators during PMR audit and during live audit.

Data Source: Billing Center of the operators
9.3 PERIOD OF APPLYING CREDIT/WAIVER

9.3.1 PARAMETER DESCRIPTION

- Computational Methodology: \( \text{Period of applying credit waiver} = \frac{\text{number of cases where credit waiver is applied within 7 days}}{\text{total number of cases eligible for credit waiver}} \times 100 \)
- TRAI Benchmark: Period of applying credit waiver within 7 days: 100%
- Audit Procedure: Operator to provide details of:
  - List of all eligible cases along with
    - Date of applying credit waiver to all the eligible cases.
    - Date of resolution of complaint for all eligible cases

9.3.2 KEY FINDINGS

All operators met the benchmark for this parameter.

Data Source: Billing Center of the operators
9.4 CALL CENTRE PERFORMANCE-IVR

9.4.1 PARAMETER DESCRIPTION

- Computational Methodology: \( \text{Call centre performance IVR} = \frac{\text{Number of calls connected and answered by IVR}}{\text{All calls attempted to IVR}} \times 100 \)
- TRAI Benchmark: \( \geq 95\% \)
- Audit Procedure: Operators provide details of the following from their central call centre/ customer service database:
  - Total calls connected and answered by IVR
  - Total calls attempted to IVR
  - Also live calling is done to test the calls connected and answered by IVR

9.4.2 KEY FINDINGS

As per PMR and live audit data, all operators met the TRAI benchmark.
9.5 CALL CENTRE PERFORMANCE-VOICE TO VOICE

9.5.1 PARAMETER DESCRIPTION

- **Computational Methodology:**
  - Call centre performance Voice to Voice = \((\text{Number of calls answered by operator within 90 seconds} / \text{All calls attempted to connect to the operator}) \times 100\)

- **Audit Procedure:**
  - Operators provide details of the following from their central call centre/ customer service database:
    - Total calls connected and answered by operator within 90 seconds
    - Total calls attempted to connect to the operator
  - Also live calling was done to test the calls answered within 90 seconds by the operator

**Benchmark:** 95% calls to be answered within 90 seconds
Reliance GSM did not meet the benchmark of answering 95% calls within 90 seconds and Airtel, Aircel, BSNL, idea, Reliance GSM did not meet the benchmark of Live calling Percentage calls getting connected and answered.
9.6 TERMINATION/CLOSURE OF SERVICE

9.6.1 PARAMETER DESCRIPTION

- Computational Methodology: Time taken for closure of service = (number of closures done within 7 days/ total number of closure requests) * 100
- TRAI Benchmark: Termination/Closure of Service: <=7 days
- Audit Procedure:
  - Operator provide details of the following from their central billing/CS database:
    - Date of lodging the closure request (all requests in given period)
    - Date of closure of service

9.6.2 KEY FINDINGS

<table>
<thead>
<tr>
<th>Percentage cases closure attended within 7 days</th>

<td>100.00%</td>
</tr>
</tbody>
</table>

Data Source: Customer Service Center of the operators

All operators met the TRAI benchmark for the parameter.
9.7 REFUND OF DEPOSITS AFTER CLOSURE

9.7.1 PARAMETER DESCRIPTION

Computational Methodology:

- Time taken for refund for deposit after closures = (number of cases of refund after closure done within 60 days/ total number of cases of refund after closure) * 100
- Any case where the operators need to return the amount back to consumers post closure of service in form of cheque/cash is considered to be refund.

TRAI Benchmark:

- Time taken for refund for deposit after closures: 100% within 60 days

Audit Procedure:

- Operator provide details of the following from their central billing/refund database:
  - Dates of completion of all ‘closure requests’ resulting in requirement of a refund by the operator.
  - Dates of refund pertaining to all closure request received during the relevant quarter.
9.7.2 KEY FINDINGS

Reliance GSM did not meet the parameter refund of deposit after closure.

Data Source: Customer Service Center of the operators
10 DETAILED FINDINGS - DRIVE TEST DATA

10.1 OPERATOR ASSISTED DRIVE TEST - VOICE

The drive test was conducted simultaneously for all the operators present in the MPCG circle. As per the new directive given by TRAI headquarters, drive test in the quarter were conducted at a SSA level. SSAs have been defined in two categories by TRAI as per the criticality of the SSA.

3. Normal SSA
4. Difficult SSA

The drive test in Normal SSA was conducted for three days with minimum distance of 250 kilometers over three days. The drive test in difficult SSAs was conducted for six days with minimum distance of 500 kilometers over six days. The selection of routes ensured that the maximum towns, villages, highways are covered as part of drive test. The routes were selected post discussion with TRAI regional teams. The holding period for all test calls was 120 seconds and gap between calls was 10 seconds.

For measuring voice quality RxQual samples for GSM operators and Frame Error Rate (FERs) for CDMA service providers were measured. RxQual greater than 5 meant that the sample was not of appropriate voice quality and for CDMA operators FERs of more than 4 were considered bad. Call drops were measured by the number of calls that were dropped to the total number of calls established during the drive test. Similarly CSSR was measured as the ratio of total calls established to the total call attempts made. Signal strength was measured in Dbm with strength > -75 dbm for indoor, -85 dbm for in-vehicle and > -95 dbm outdoor routes.

The schedule and operators involved in the operator assisted drive test for MPCG circle are given below.

The route maps given in the report are provided for the purpose of identifying the routes traversed during the drive tests. We observe three different colours (Red/Green/Yellow) of the lines, which signify signal strength; however these maps are for a single operator and have not been referred to any findings in this report. IMRB submits detailed operator wise Drive Test reports separately.
10.1.2.3 Route Map - DEWAS DAY 1

Route Covered: Day 1
Route Detail:
1) Dewas
Within City - Bus Stand, Main Market, Karamchari colony, Motti Bunglow, Ram Nagar, Old Dewas, MIG housing board colony
Highway - Shapal road, Indore road, Ujjain road, Maksi road
Major Road - AB road, MG road, Ram Nagar, Adarsh Nagar, Mandki road, Ganga Nagar
10.1.2.4 Route Map - DEWAS DAY 2

Route Covered: day 2
Route Detail:

1) Khategaon

Within City - Bus Stand, IMI Bazar, Tilak Marg, JP colony, Nemawar road, Patwari Mohalla.

Highway - Kannod road, Nemawar road

Major Road - Bus Stand, Tilak Marg, Dubey Mohalla, JP colony.

### 13.5 LIVE CALLING RESULTS FOR RESOLUTION OF SERVICE REQUESTS

![Table showing live calling results for service requests with data from operators' networks.](data:image/png;base64,SGVsbG8sIFdvcmxkIQ==)

**Data Source:** Live calls made by auditors from operator's network

### 13.6 LIVE CALLING RESULTS FOR LEVEL 1 SERVICES

![Table showing live calling results for level 1 services.](data:image/png;base64,SGVsbG8sIFdvcmxkIQ==)
### 13.7 LEVEL 1 SERVICE CALLS MADE

All the numbers given in mandatory list in Section 2.4.2.4.1 were tested. The following table provides the numbers that are activated for each operator. A tick (✓) for an operator signifies that the number was active for the operator.

Live calls were made to the active numbers to test the calls answered. The details of the same have been given below for each operator.

</tr>
</tbody>
</table>
| 3      | TCH congestion= (TCH Failures /TCH Attempts)% | **TCH Failures** = ([Failed TCH Seizures due to Busy TCH (Signaling Channel)] + [Failed Assignments (First Assignment, No Channel Available in Assignment Procedure)] + [Failed Assignments (First Assignment, No Channel Available in Directed Retry Procedure)] + [Failed Assignments (Reconnection to Old Channels, No Channel Available in Assignment) + [Failed Assignments (Reconnection to Old Channels, No Channel Available in Directed Retry)]) | **TCH Attempts** = (Assignment Requests (Signaling Channel) (TCH)] + [Assignment Requests (Signaling Channel) (SDCCH)] + [Assignment Requests (TCH Only)] + [Assignment Requests (TCHH Only)] + [Assignment Requests (TCHF Preferred, Channel Type Unchangeable)] + [Assignment Requests (TCHH Preferred, Channel Type Unchangeable)] + [Assignment Requests (TCHF or TCHH, Channel Type Unchangeable)] + [Assignment Requests (TCHF Preferred, Channel Type Changeable)] + [Assignment Requests (TCHH Preferred, Channel Type Changeable)] + [Assignment Requests (TCHF or TCHH, Channel Type Changeable)] + [Assignment Requests (TCHF or TCHH, Channel Type Changeable)]
### Call Drop Rate

\[
\text{Call Drop Rate} = \frac{\text{The total no of dropped calls} \times 100}{\text{Total no of calls successfully established (where traffic channel is allotted)}}
\]

**The total no of dropped calls** = 
\[
\text{[Call Drops on Radio Interface in Stable State (Traffic Channel)]} + \text{[Call Drops on Radio Interface in Handover State (Traffic Channel)]} + \text{[Call Drops due to No MR from MS for a Long Time (Traffic Channel)]} + \text{[Call Drops due to Abis Terrestrial Link Failure (Traffic Channel)]} + \text{[Call Drops due to Equipment Failure (Traffic Channel)]} + \text{[Call Drops due to Forced Handover (Traffic Channel)]} + \text{[Call Drops due to local switching Start Failure] + [Call Drops due to Failures to Return to Normal Call from local switching]}
\]

**Total no of calls successfully established (where traffic channel is allotted)** = 
\[
\text{[Assignment Requests] - [Failed Assignments (Signaling Channel)] - [Failed Assignments during MOC on the A Interface (Including Directed Retry)] - [Failed Assignments during MTC on the A Interface (Including Directed Retry)] - [Failed Assignments during Emergency Call on the A Interface (Including Directed Retry)] - [Failed Assignments during Call Re-establishment on the A Interface (Including Directed Retry)] - [Failed Mode Modify Attempts (MOC) (TCHF)] - [Failed Mode Modify Attempts (MTC) (TCHF)] - [Failed Mode Modify Attempts (Emergency Call) (TCHF)] - [Failed Mode Modify Attempts (Call Re-establishment) (TCHF)] - [Failed Mode Modify Attempts (MOC) (TCHH)] - [Failed Mode Modify Attempts (MTC) (TCHH)] - [Failed Mode Modify Attempts (Call Re-establishment) (TCHH)]}
\]

### Call Drop Rate

\[
\text{Call Drop Rate} = \frac{\text{No of cells having call drop rate >3% during CBBH in a month} \times 100}{\text{Total no of cells in the licensed service area}}
\]

Above formula with counters being used in CBBH.

### Connection with good quality voice

\[
\text{Connection with good quality voice} = \left(\frac{\text{Connection with good quality voice}}{\text{Total voice samples}}\right)\%
\]

\[
\text{Connection with good quality voice} = \left(\frac{\text{Number of MRs on Downlink TCHF (Receive Quality Rank 0)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 1)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 2)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 3)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 4)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 5)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 6)} + \text{Number of MRs on Downlink TCHF (Receive Quality Rank 7)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 0)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 1)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 2)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 3)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 4)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 5)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 6)} + \text{Number of MRs on Downlink TCHH (Receive Quality Rank 7)}}{\text{Total voice samples}}\right)
\]
14.1.1 ERICSSON

## 15 Abbreviations

Following terms/abbreviations have been used in this report. This section provides meaning of the abbreviations used in the report.

1. TRAI – Telecom Regulatory Authority of India
2. QoS – Quality of Service
3. JAS’16 – Refers to the quarter of July, August and September 2016
4. IMRB – Refers to IMRB International, the audit agency for this report
5. SSA – Secondary Switching Area
6. NOC – Network Operation Center
7. OMC – Operations and Maintenance Center
8. MSC – Mobile Switching Center
9. PMR – Performance Monitoring Reports
10. TCBH – Time Consistent Busy Hour
11. CBBH - Cell Bouncing Busy Hour
12. BTS – Base Transceiver Station
13. CSSR – Call Setup Success Rate
14. TCH – Traffic Channel
15. SDCCH – Standalone Dedicated Control Channel
16. CDR – Call Drop Rate
17. FER – Frame Error Rate
18. SIM – Subscriber Identity Module
19. GSM – Global System for Mobile
20. CDMA – Code Division Multiple Access
21. NA – Not Applicable
22. NC – Non Compliance
23. POI – Point of Interconnection
24. IVR – Interactive Voice Response
25. STD – Standard Trunk Dialing
26. ISD – International Subscriber Dialing
